

TRW have established their second North American Driver Assist Systems (DAS) Engineering Center at the company's Livonia, Michigan, headquarters. The new engineering center will focus on the development and testing of advanced radar applications to support TRW's North American customers, and will work closely with the Camera Development Center located in nearby Farmington Hills, Michigan.

The new DAS center will use the world-class labs and test track facilities already established in the region and will work closely with well-established European DAS engineering centers in Birmingham, UK, and Koblenz, Germany, while liaising with the company's specialist radar production facility in Brest, France. The establishment of the new center is part of TRW's global strategy to provide customers with professional support for DAS applications on each of the three major continents. The company has also placed resident DAS engineers in Japan and Korea. The new center will specialize in vehicle, and application, level DAS development and will take full advantage of the synergies available with the braking technical center in Livonia.
