

Hella have introduced their new RotaLED Compact beacon as a successor to the the halogen Rotafix, Rotaflex, and Rota Compact beacons.

Compact design makes the RotaLED especially suitable for agricultural and construction machines—and LEDs' extreme vibrationproofing augments that suitability. The smooth, impact-resistant polycarbonate dome is well sealed against entry of dirt, dust, and water. Moreover, the new LED version has functionalities not available with the old halogens. The flashing light function, for example, creates a stark warning effect.

As for mounting: in addition to magnetic and fixed attachment, the RotaLED can also be attached using flexible pipe sockets. The cushioned base absorbs impacts and shocks, e.g. by branches; the beacon simply leans around the branch and pops back up to its original position. And in case of extreme impact, the rubber base's interlock lets go if deflected by more than 30 degrees. Then the beacon can be put back in its original place by releasing three pipe socket screws.
